

Ridge estimation of the VAR(1) model and its time series chain graph from multivariate time course omics data

Viktorian Miok, Saskia Wilting and Wessel van Wieringen

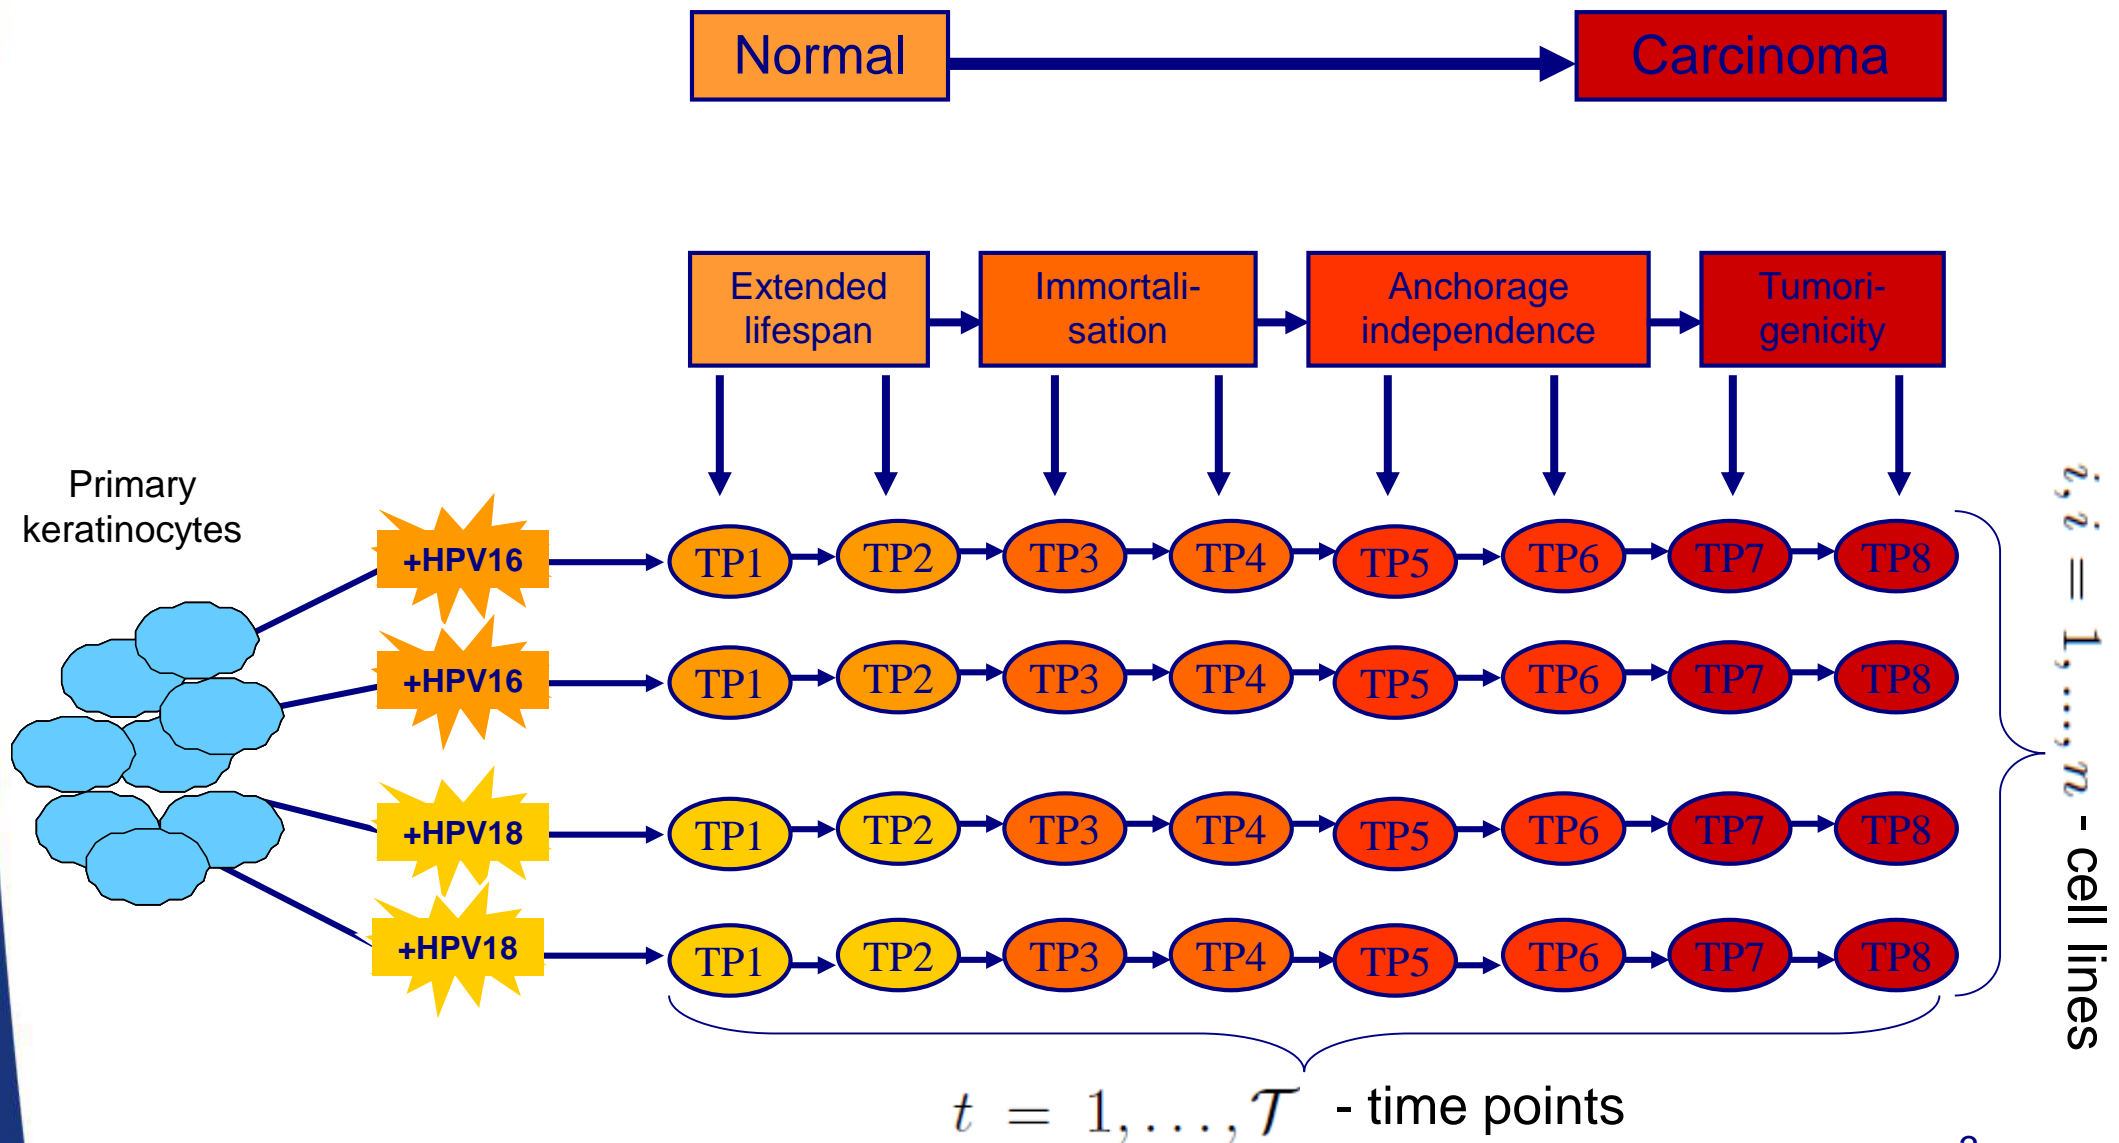

Cervical cancer study

- Second most common cancer in women worldwide.
- Caused by HPV virus, in 70% cases HPV16 and HPV18.
- Cell line model – in vitro model system of HPV-induced transformation.
- Aim: reconstruct interaction among the genes.

| HPV

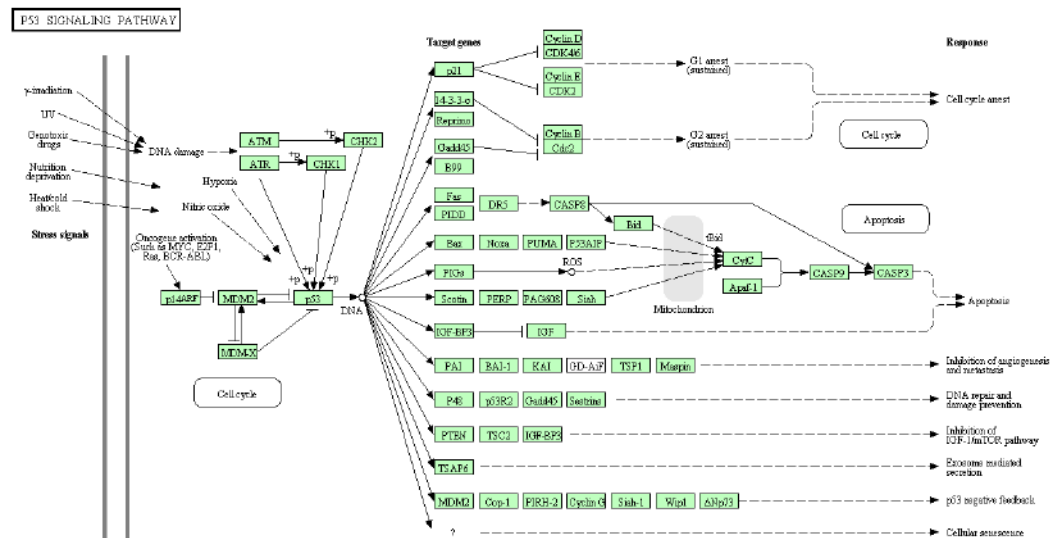

Experiment

Pathways

- Pathway are defined using repositories: **KEGG, GO, Reactome...**

- Problems with repositories:
 - Incomplete
 - Mostly well-known pathways
 - Loosely defined
- Reconstruction of the p 53 signaling pathway in cervical cancer

Model

$Y_{*,t,i}$ - mRNA gene expression

VAR(1) process: $Y_{*,t,i} = AY_{*,t-1,i} + \epsilon_{*,t,i}$

First gene: $Y_{1,t,i} = a_{1,1}Y_{1,t-1,i} + a_{1,2}Y_{2,t-1,i} + a_{1,3}Y_{3,t-1,i} + \epsilon_{1,t,i}$

● node, a gene

→ edge, two gene interaction

Estimators

Ridge penalized log-likelihood: $\log[L(\mathbf{Y}; \mathbf{A}, \mathbf{\Omega}_\varepsilon)] - \lambda_\omega \|\mathbf{\Omega}_\varepsilon - \mathbf{\Omega}_0\|_2^2 - \lambda_a \|\mathbf{A} - \mathbf{A}_0\|_2^2$

VAR(1) log-likelihood function Ridge penalties

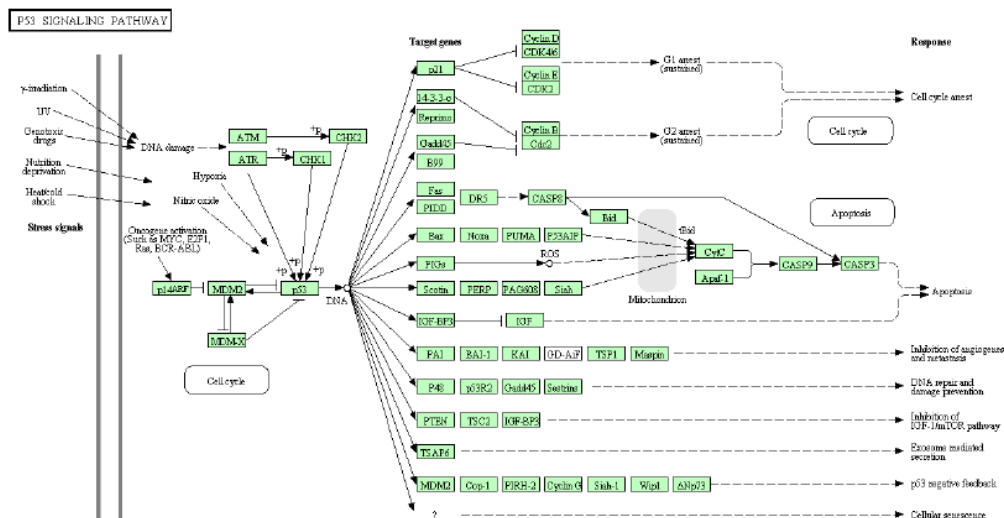

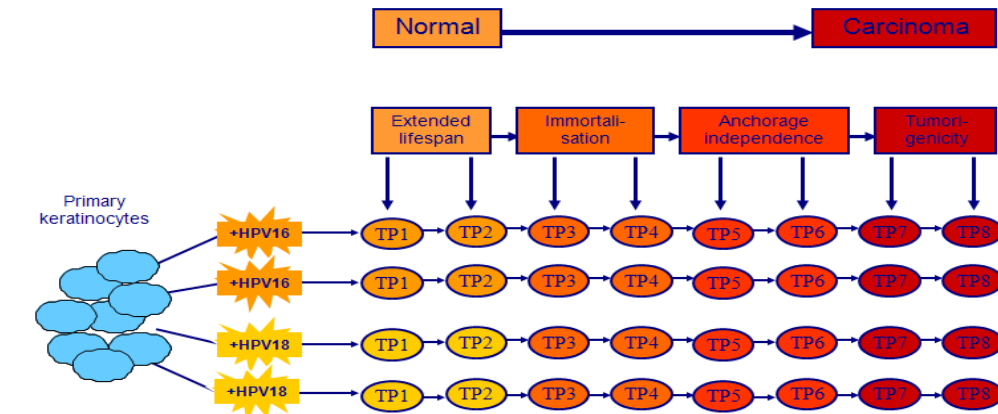

$\mathbf{A}_0, \mathbf{\Omega}_0$ - target matrices

Maximization derive the estimators, in iterative procedure:

$$\text{vec}[\hat{\mathbf{A}}(\lambda)] = [\lambda_a \mathbf{I}_{p^2 \times p^2} + \hat{\mathbf{\Gamma}}(0) \otimes \mathbf{\Omega}_\varepsilon]^{-1} \{ \lambda_a \text{vec}(\mathbf{A}_0) + \text{vec}[\mathbf{\Omega}_\varepsilon \hat{\mathbf{\Gamma}}(-1)] \}$$

$$\hat{\mathbf{\Omega}}_\varepsilon(\lambda_\omega) = \left\{ \left[\lambda_\omega \mathbf{I}_{p \times p} + \frac{1}{4} (\mathbf{S}_\varepsilon - \lambda_\omega \mathbf{\Omega}_0)^2 \right]^{1/2} + \frac{1}{2} (\mathbf{S}_\varepsilon - \lambda_\omega \mathbf{\Omega}_0) \right\}^{-1}$$

t+1

Sparse model parameters

- Penalty parameters estimated using leave-one-out cross-validated log likelihood
- Using local FDR non zero elements of interest are obtained

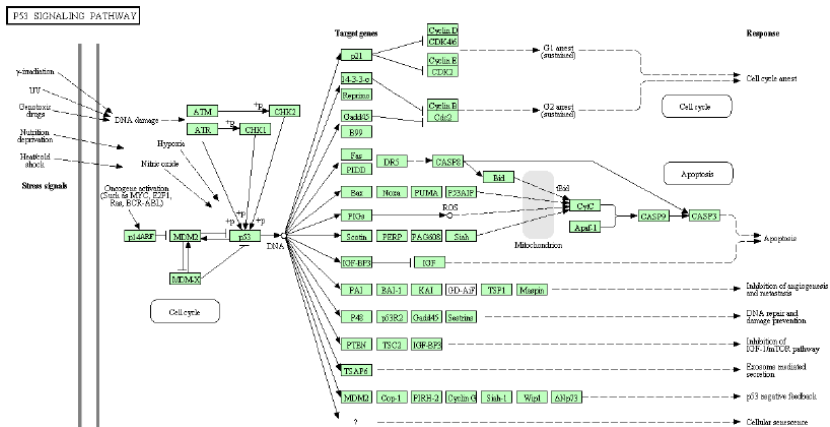

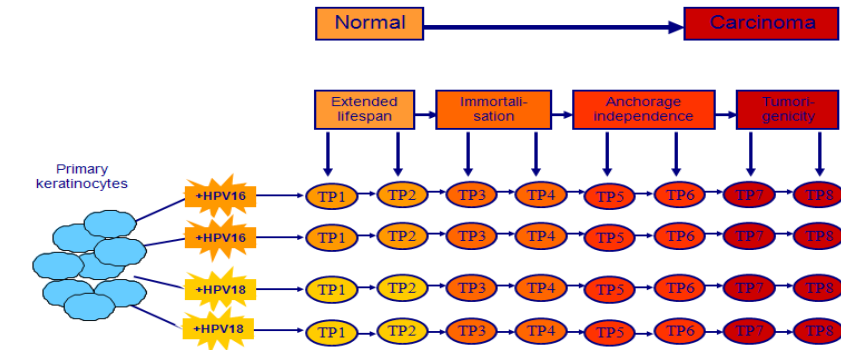

Prior knowledge

- Re-estimated parameters of **A**, taking the support of **A** into account
- Support of **A** formulated as linear constraints on **A**
- Less biased estimates of **A**

Network

Ridge estimation of VAR(1) model

t

 $t+1$

Comparison - ridge vs. SCAD

Data

- Simulated data ($p=25$, $T=10$, $n=5$)

Frobenius loss of the estimates

- Optimal penalty parameters
- Reconstruction of time series chain graph

Model fit

- Fit of the TP73 gene:

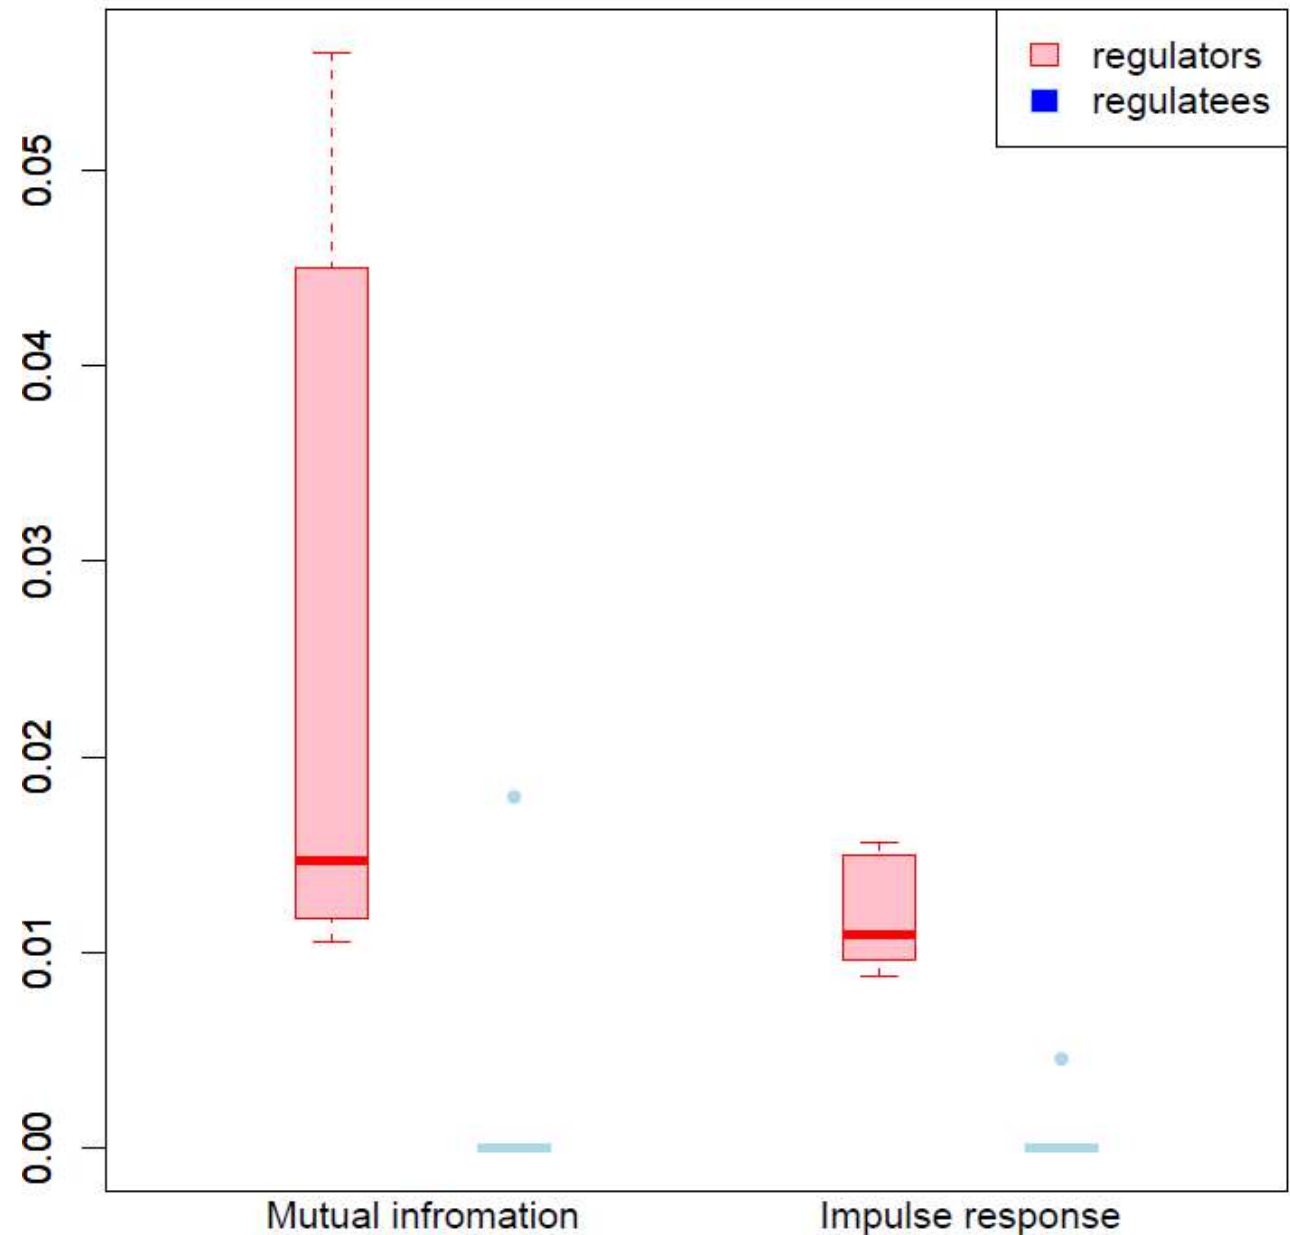

- Histogram of the fit vs. observation:

Node statistics

- Node statistics of the 'regulators' and 'regulatees'

from

Motifs

- Building block of the pathways
- Carry out specific dynamic function
- Deregulation lead to cancer formation

Summary

- Reconstruction of the temporal interaction between genes
- Comparison in simulation study with SCAD, lasso based competitor
- Down-stream analysis presented on p53 signaling pathway
- Post estimation analysis: node statistics, impulse response, mutual information, path decomposition and motifs
